

Algebraic Statistics for Computational Biology

Lior Pachter and Bernd Sturmfels

Department of Mathematics, University of California, Berkeley, CA 94720, USA

We discuss recent interactions between algebra and statistics and their emerging applications to computational biology. Statistical models of independence and alignments for DNA sequences will be illustrated by means of a fictional character, DiaNA, who rolls tetrahedral dice with face labels A, C, G, T. This lecture provides an introduction to our new book on this subject which is published by Cambridge University Press.
