Pablo Groisman Stochastic Differential Equations with explosions

The Problem

$$dx = b(x) dt + \sigma(x) dW$$

 $x(0) = z \in \mathbb{R}_{>0}$

- ▶ W is a one dimensional Wiener process (dW is "white noise")
- *b*, σ are smooth and positive.

That is ...

The Problem

$$dx = b(x) dt + \sigma(x) dW$$

 $x(0) = z \in \mathbb{R}_{>0}$

W is a one dimensional Wiener process (dW is "white noise")
b, σ are smooth and positive.

That is ...
$$x = x(t) = x(\omega, t)$$
 is a stochastic process that verifies

$$x(t) = z + \int_0^t b(x(s)) ds + \int_0^t \sigma(x(s)) dW(s).$$

Pablo Groisman Stochastic Differential Equations wit<u>h explosions</u>

The Problem

$$dx = b(x) dt + \sigma(x) dW$$

$$x(0) = z \in \mathbb{R}_{>0}$$

- W is a one dimensional Wiener process (dW is "white noise")
- *b*, σ are smooth and positive.

That is ... $x = x(t) = x(\omega, t)$ is a stochastic process that verifies

$$x(t) = z + \int_0^t b(x(s)) ds + \int_0^t \sigma(x(s)) dW(s).$$

If *b* is not globally Lipschitz, solutions to this problem may explode in finite time.

(日) (同) (三) (三)

ODE vs. SDE

Pablo Groisman Stochastic Differential Equations with explosions

UBA

Explosions

There exist a stopping time T such that $x(\omega, t)$ is defined in $[0, T(\omega))$, but

$$x(\omega,t) \nearrow +\infty$$
 as $t \nearrow T(\omega)$.

< 17 >

Pablo Groisman Stochastic Differential Equations with explosions

Fatigue Cracking

- This kind of SDE are used, for example, to model fatigue cracking (fatigue failures in solid materials)
- x(t) represents the evolution of the length of the largest crack.
- The explosion time corresponds to the time of ultimate damage or fatigue failure in the material.

Adaptive numerical scheme

Explosions in evolution problems

4. SPDE: $u_t = u_{xx} + u^p \dot{W}$.

Pablo Groisman Stochastic Differential Equations with explosions

UBA

4. SPDE: $u_t = u_{xx} + u^p \dot{W}$. Blow-up if p > 3/2. Global solutions if p < 3/2 (C. Mueller, 2000)

4. SPDE: $u_t = u_{xx} + u^p \dot{W}$. Blow-up if p > 3/2. Global solutions if p < 3/2 (C. Mueller, 2000)

Both for SDE and SPDE:

Pablo Groisman Stochastic Differential Equations with explosions

4. SPDE: $u_t = u_{xx} + u^p \dot{W}$. Blow-up if p > 3/2. Global solutions if p < 3/2 (C. Mueller, 2000)

Both for SDE and SPDE: No further results on (for example) the behavior of the explosion time, the set where explosions occur, numerical computation of the solutions, etc.

Our work...

Theoretical study of the regularity of the explosion time

Pablo Groisman Stochastic Differential Equations with explosions

UBA

Our work...

- Theoretical study of the regularity of the explosion time
- Numerical approximations for this kind of problems

Numerical approximations

We assume

•
$$0 < C_1 \le \sigma^2(s) \le C_2 b(s).$$

•
$$b(s)$$
 is nondecreasing for $s > s_0$ and $\int_{-\infty}^{\infty} \frac{1}{b(s)} ds < \infty$.

Under these conditions, explosions occur with probability one. **Example:**

$$dx = (1 + x^2) \, dt + dW$$

The Euler-Maruyama scheme (for bounded solutions)

 $dx = b(x) \, dt + \sigma(x) \, dW$

(日) (同) (三) (三)

$$X_{i+1} = X_i + hb(X_i) + \sigma(X_i)\Delta W_i$$

Not suitable for solutions with explosions! The numerical solution is defined for every positive time.

UBA

Introduction

$$X_{i+1} = X_i + hb(X_i) + \sigma(X_i)\Delta W_i$$

- Not suitable for solutions with explosions! The numerical solution is defined for every positive time.
- The time step h can not be constant. It must be adapted as the solution increases.

Introduction

$$X_{i+1} = X_i + hb(X_i) + \sigma(X_i)\Delta W_i$$

- Not suitable for solutions with explosions! The numerical solution is defined for every positive time.
- The time step h can not be constant. It must be adapted as the solution increases.
- We propose $h_i = \frac{h}{b(X_i)}$. i.e. $t_{i+1} t_i = \frac{h}{b(X_i)}$

 $X_{i+1} = X_i + h_i b(X_i) + \sigma(X_i) \Delta W_i = X_i + h + \sigma(X_i) \Delta W_i$

・ロン ・四 と ・ ヨン ・ ヨン

(ロ) (日) (日) (日) (日)

URA

The numerical solution

$$X(t_i)=X_i,$$

 $X(t) = X_i + (t-t_i)b(X_i) + \sigma(X_i)(W(t) - W(t_i)), \quad \text{ for } t \in [t_i, t_{i+1}).$

is a well defined process up to time

$$T_h = \sum_{i=1}^{\infty} h_i = \sum_{i=1}^{\infty} \frac{h}{b(X_i)}.$$

We say that the numerical solution explode in finite time T_h if

 $T_h < \infty$

Pablo Groisman Stochastic Differential Equations with explosions

Mean Square Convergence (while solutions are bounded)

Theorem 1: Fix a time S > 0 and a constant M > 0. Consider the stopping times given by

$$egin{aligned} R^M &:= \inf\{t: x(t) = M\} \quad R^M_h := \inf\{t: X(t) = M\} \ && au_h = R^M \wedge R^M_h \wedge S \end{aligned}$$

Then

$$\lim_{h\to 0}\mathbb{E}\left[\sup_{0\leq t\leq \tau_h}|x(t)-X(t)|^2\right]=0.$$

Explosions in the Numerical Scheme Theorem 2:

- 1. $X(\cdot)$ explodes in finite time with probability one.
- 2. For every h > 0 we have,

$$\lim_{i\to\infty}\frac{X(t_i)}{hi}=1 \quad \text{i.e} \quad X(t_i)\sim hi$$

(This is the asymptotic behavior of the numerical solution, since the behavior of

$$t_i = \sum_{j=1}^{i-1} \frac{h}{b(X_j)}$$

can also be computed.)

URA

Explosions in the Numerical Scheme Theorem 2:

- 1. $X(\cdot)$ explodes in finite time with probability one.
- 2. For every h > 0 we have,

$$\lim_{i\to\infty}\frac{X(t_i)}{hi}=1 \quad \text{i.e} \quad X(t_i)\sim hi$$

(This is the asymptotic behavior of the numerical solution, since the behavior of

$$t_i = \sum_{j=1}^{i-1} \frac{h}{b(X_j)}$$

can also be computed.)

For example, if $b(s) \sim s^p$ (p>1), the explosion rate is

$$X(t_i)(T_h - t_i)^{1/(p-1)} \to \left(\frac{1}{p-1}\right)^{\frac{1}{p-1}} \text{as } t_i \nearrow T_h.$$

Pablo Groisman

Stochastic Differential Equations with explosions

Proof:

$$X_{i+1} = X_i + h_i b(X_i) + \sigma(X_i) \Delta W_i = X_i + h + \sigma(X_i) \Delta W_i$$

Pablo Groisman Stochastic Differential Equations with explosions

UBA

Proof:

$$X_{i+1} = X_i + h_i b(X_i) + \sigma(X_i) \Delta W_i = X_i + h + \sigma(X_i) \Delta W_i$$

$$X_{i+1} = z + ih + \sum_{j=1}^{i} \sigma(X_j) \Delta W_j$$

Since "
$$\Delta W_j \sim N(0, h_j)$$
",

$$\frac{\sum_{j=1}^{i} \sigma(X_j) \Delta W_j}{i} \sim \frac{\sum_{j=1}^{i} \sqrt{\frac{h}{b(X_j)}} \sigma(X_j) Z_j}{i} \rightarrow 0, \text{ then}$$

$$\frac{X_i}{ih} \rightarrow 1 \quad \text{a.s., and hence}$$

$$\sum_{i=i_0}^{\infty} \tau_i = \sum_{i=i_0}^{\infty} \frac{h}{b(X_i)} \sim \int_{X_{i_0-1}}^{\infty} \frac{1}{b(u)} du < +\infty, \quad \text{a.s.}$$
