# EXISTENCE RESULTS FOR THE $p$-LAPLACIAN WITH NONLINEAR BOUNDARY CONDITIONS 

JULIÁN FERNÁNDEZ BONDER AND JULIO D. ROSSI

#### Abstract

In this paper we study the existence of nontrivial solutions for the problem, $\Delta_{p} u=|u|^{p-2} u$ in a bounded smooth domain $\Omega \subset \mathbb{R}^{N}$, with a nonlinear boundary condition given by $|\nabla u|^{p-2} \partial u / \partial \nu=f(u)$ on the boundary of the domain. The proofs are based on variational and topological arguments.

## 1. Introduction.

In this paper we study the existence of nontrivial solutions for the following problem

$$
\left\{\begin{align*}
\Delta_{p} u & =|u|^{p-2} u & & \text { in } \Omega,  \tag{1.1}\\
|\nabla u|^{p-2} \frac{\partial u}{\partial \nu} & =f(u) & & \text { on } \partial \Omega .
\end{align*}\right.
$$

Here $\Omega$ is a bounded domain in $\mathbb{R}^{N}$ with smooth boundary, $\Delta_{p} u=\operatorname{div}\left(|\nabla u|^{p-2} \nabla u\right)$ is the $p$-Laplacian and $\frac{\partial}{\partial \nu}$ is the outer normal derivative.

Problems of the form (1.1) appears in a natural way when one considers the Sobelev trace inequality

$$
S^{1 / p}\|u\|_{L^{q}(\partial \Omega)} \leq\|u\|_{W^{1, p}(\Omega)}, \quad 1 \leq q \leq p^{*}=\frac{p(N-1)}{N-p}
$$

In fact, the extremals (if there exists) are solutions of (1.1) for $f(u)=\lambda|u|^{q-2} u$. See [10] for a detailled analysis of the behaviour of extremals and best Sobolev constants in expanding domains for $p=2$ in the subcritical case, $1<q<\frac{2(N-1)}{N-2}$.

Also, one is lead to nonlinear boundary conditions in the study of conformal deformations on Riemannian manifolds with boundary, see for example [5], [11] and [12].

The study of existence when the nonlinear term is placed in the equation, that is when one consider a quasilinear problem of the form $-\Delta_{p} u=f(u)$ with Dirichlet boundary conditions, has received considerable attention, see for example [15], [16], [21], etc.

However, nonlinear boundary conditions have only been considered in recent years. For the Laplace operator with nonlinear boundary conditions see for example [7], [8], [10], [17], [25]. For elliptic systems with nonlinear boundary conditions see [13], [14]. For previous work for the $p$-Laplacian with nonlinear boundary conditions of different type see [6] and [22].

[^0]In this work, for solutions of (1.1) we understand critical points of the associated energy functional

$$
\begin{equation*}
\mathcal{F}(u)=\frac{1}{p} \int_{\Omega}|\nabla u|^{p}+|u|^{p} d x-\int_{\partial \Omega} F(u) d \sigma \tag{1.2}
\end{equation*}
$$

where $F^{\prime}(u)=f(u)$ and $d \sigma$ is the measure on the boundary.
Along this paper we fix $1<p<N$ and look for conditions on the nonlinear term $f(u)$ that provide us with the existence of nontrivial solutions of (1.1).

This functional $\mathcal{F}$ is well defined and $C^{1}$ in $W^{1, p}(\Omega)$ if $f$ has a critical or subcritical growth, namely $|f(u)| \leq C\left(1+|u|^{q}\right)$ with $1 \leq q \leq p^{*}=\frac{p(N-1)}{N-p}$. Moreover, in the subcritical case $1<q<p^{*}$, the immersion $W^{1, p}(\Omega) \hookrightarrow L^{q}(\partial \Omega)$ is compact while in the critical case $q=p^{*}$ is only continuous.

First, we deal with a superlinear and subcritical nonlinearity. For simplicity we will consider

$$
\begin{equation*}
f(u)=\lambda|u|^{q-2} u \tag{1.3}
\end{equation*}
$$

where $q$ verifies

$$
1<q<p^{*}=\frac{p(N-1)}{N-p}
$$

In these cases we prove the following Theorems using standard variational arguments together with the Sobolev trace immersion that provide the necessary compactness. See [16] for similar results for the $p$-Laplacian with Dirichlet boundary conditions.
Theorem 1.1. Let $f$ satisfy (1.3) with $p<q<p^{*}$, then there exists infinitely many nontrivial solutions of (1.1) which are unbounded in $W^{1, p}(\Omega)$.
Theorem 1.2. Let $f$ satisfy (1.3) with $1<q<p$, then there exists infinitely many nontrivial solutions of (1.1) which form a compact set in $W^{1, p}(\Omega)$.
Theorem 1.3. Let $f$ satisfy (1.3) with $p=q$, then there exists a sequence of eigenvalues $\lambda_{n}$ of (1.1) such that $\lambda_{n} \rightarrow+\infty$ as $n \rightarrow+\infty$.

In the case $p=q$, the equation and the boundary condition are homogeneous of the same degree, so we are dealing with a nonlinear eigenvalue problem. In the linear case, that is for $p=2$, this eigenvalue problem is known as the Steklov problem, [2].

Next we consider the critical growth on $f$. As we have pointed out, in this case the compactness of the immersion $W^{1, p}(\Omega) \hookrightarrow L^{p^{*}}(\partial \Omega)$ fails, so in order to recover some sort of compactness, in the same spirit of [3], we consider a perturbation of the critical power, that is

$$
\begin{equation*}
f(u)=|u|^{p^{*}-2} u+\lambda|u|^{r-2} u=|u|^{\frac{p(N-1)}{N-p}-2} u+\lambda|u|^{r-2} u . \tag{1.4}
\end{equation*}
$$

Here we use the compensated compactness method introduced in [19], [20] and follow ideas from [15]. We prove the following two Theorems.
Theorem 1.4. Let $f$ satisfy (1.4) with $p<r<p^{*}$, then there exists a constant $\lambda_{0}>0$ depending on $p, r, N$ and $\Omega$, such that if $\lambda>\lambda_{0}$, problem (1.1) has at least a nontrivial solution in $W^{1, p}(\Omega)$.
Theorem 1.5. Let $f$ satisfy (1.4) with $1<r<p$, then there exists a constant $\lambda_{1}>0$ depending on $p, r, N$ and $\Omega$ such that if $0<\lambda<\lambda_{1}$, problem (1.1) has infinitely many nontrivial solutions in $W^{1, p}(\Omega)$.

Next, we deal with supercritical growth on $f$. More precisely, we study a subcritical perturbation of the supercritical power, that is, we consider

$$
\begin{equation*}
f(u)=\lambda|u|^{q-2} u+|u|^{r-2} u \tag{1.5}
\end{equation*}
$$

with $q \geq p^{*}>r>p$. In this case, not only the compactness fails but also the functional $\mathcal{F}$ given in (1.2) is not well defined in $W^{1, p}(\Omega)$, so we have to perform a truncation in the nonlinear term $\lambda|u|^{q-2} u$ following ideas from [4]. For this case we have,
Theorem 1.6. Let $f$ satisfy (1.5) with $q \geq p^{*}>r>p$, then there exists $a$ constant $\lambda_{2}$ depending on $p, q, r, N$ and $\Omega$ such that if $0<\lambda<\lambda_{2}$, problem (1.1) has a nontrivial positive solution in $W^{1, p}(\Omega) \cap L^{\infty}(\partial \Omega)$.

Finally, we end this article with a nonexistence result for (1.1) in the half-space $\mathbb{R}_{+}^{N}=\left\{x_{1}>0\right\}$ that shows that existence may fail when one consider critical or subcritical growth in an unbounded domain. This nonexistence result is a consequence of a Pohozaev type identity.
Theorem 1.7. Let $f$ satisfies (1.3) with $q \leq p^{*}$. Let $u \in W^{1, p}\left(\mathbb{R}_{+}^{N}\right) \cap C^{2}\left(\overline{\mathbb{R}_{+}^{N}}\right) \cap$ $L^{q}\left(\partial \mathbb{R}_{+}^{N}\right)$ be a nonnegative solution of (1.1) such that

$$
|\nabla u(x)||x|^{\frac{N}{p}} \rightarrow 0, \quad \text { as } \quad|x| \rightarrow+\infty .
$$

Then $u \equiv 0$.
We remark that the decay hypothesis at infinity is necessary, because for $p=2$ $u(x)=e^{-x_{1}}$ is a solution of (1.1) for every $q$.

The rest of the paper is organized as follows, in $\S \S 2,3$ and 4 we deal with the subcritical case. In $\S 2$ we prove Theorem 1.1, in $\S 3$ Theorem 1.2 and in $\S 4$ Theorem 1.3. Next, in $\S \S 5$ and 6 we consider the critical case. In $\S 5$ we prove Theorem 1.4 and in $\S 6$ Theorem 1.5. In $\S 7$ we deal with the supercritical problem, Theorem 1.6 and finally in $\S 8$ we prove our nonexistence result, Theorem 1.7.

## 2. Proof of Theorem 1.1. The subcritical case I

In this section we study (1.1) with $f(u)=\lambda|u|^{q-2} u$ with $p<q<p^{*}$.
Let us begin with the following Lemma that will be helpful in order to prove the Palais-Smale condition.
Lemma 2.1. Let $\phi \in W^{1, p}(\Omega)^{\prime}$. Then there exists a unique weak solution $u \in$ $W^{1, p}(\Omega)$ of

$$
\begin{equation*}
-\Delta_{p} u+|u|^{p-2} u=\phi \tag{2.1}
\end{equation*}
$$

Moreover, the operator $A_{p}: \phi \mapsto u$ is continuous.
Proof. Let us observe that weak solutions $u \in W^{1, p}(\Omega)$ of (2.1) are critical points of the functional

$$
I(u)=\frac{1}{p} \int_{\Omega}|\nabla u|^{p}+|u|^{p} d x-\langle\phi, u\rangle
$$

where $\langle\cdot, \cdot\rangle$ denotes the duality paring in $W^{1, p}(\Omega)$. Hence, existence and uniqueness are a consequence of the fact that $I$ is a weakly lower semi-continuous, strictly convex and bounded below functional.

For the continuous dependence, let us first recall the following inequality (cf. [24])

$$
\left(|x|^{p-2} x-|y|^{p-2} y, x-y\right) \geq\left\{\begin{array}{l}
C_{p}|x-y|^{p} \quad \text { if } p \geq 2  \tag{2.2}\\
C_{p} \frac{|x-y|^{2}}{(|x|+|y|)^{2-p}} \quad \text { if } p \leq 2
\end{array}\right.
$$

where $(\cdot, \cdot)$ denotes the usual scalar product in $\mathbb{R}^{m}$.
Now, given $\phi_{1}, \phi_{2} \in W^{1, p}(\Omega)^{\prime}$ let us consider $u_{1}, u_{2} \in W^{1, p}(\Omega)$ the corresponding solutions of problem (2.1). Then, for $i=1,2$ we have,

$$
\int_{\Omega}\left|\nabla u_{i}\right|^{p-2} \nabla u_{i}\left(\nabla u_{1}-\nabla u_{2}\right)+\left|u_{i}\right|^{p-2} u_{i}\left(u_{1}-u_{2}\right)-\phi_{i}\left(u_{1}-u_{2}\right) d x=0
$$

Hence, substracting and using inequality (2.2) we obtain, for $p \geq 2$,

$$
\begin{aligned}
C_{p} \int_{\Omega}\left|\nabla u_{1}-\nabla u_{2}\right|^{p}+\left|u_{1}-u_{2}\right|^{p} d x & \leq\left\langle\left(\phi_{1}-\phi_{2}\right),\left(u_{1}-u_{2}\right)\right\rangle \\
& \leq\left\|\phi_{1}-\phi_{2}\right\|_{W^{1, p}(\Omega)^{\prime}}\left\|u_{1}-u_{2}\right\|_{W^{1, p}(\Omega)}
\end{aligned}
$$

Therefore,

$$
\left\|A_{p}\left(\phi_{1}\right)-A_{p}\left(\phi_{2}\right)\right\|_{W^{1, p}(\Omega)} \leq C\left(\left\|\phi_{1}-\phi_{2}\right\|_{W^{1, p}(\Omega)^{\prime}}\right)^{\frac{1}{p-1}}
$$

Now, for the case $p \leq 2$, we first observe that
$\int_{\Omega}\left|\nabla\left(u_{1}-u_{2}\right)\right|^{p} d x \leq\left(\int_{\Omega} \frac{\left|\nabla\left(u_{1}-u_{2}\right)\right|^{2}}{\left(\left|\nabla u_{1}\right|+\left|\nabla u_{2}\right|\right)^{2-p}} d x\right)^{\frac{p}{2}}\left(\int_{\Omega}\left(\left|\nabla u_{1}\right|+\left|\nabla u_{2}\right|\right)^{p} d x\right)^{\frac{2-p}{2}}$
and

$$
\int_{\Omega}\left|u_{1}-u_{2}\right|^{p} d x \leq\left(\int_{\Omega} \frac{\left|u_{1}-u_{2}\right|^{2}}{\left(\left|u_{1}\right|+\left|u_{2}\right|\right)^{2-p}} d x\right)^{\frac{p}{2}}\left(\int_{\Omega}\left(\left|u_{1}\right|+\left|u_{2}\right|\right)^{p} d x\right)^{\frac{2-p}{2}}
$$

As in the previous case, we get,

$$
\begin{equation*}
\frac{\left\|u_{1}-u_{2}\right\|_{W^{1, p}(\Omega)}}{\left(\left\|u_{1}\right\|_{W^{1, p}(\Omega)}+\left\|u_{2}\right\|_{W^{1, p}(\Omega)}\right)^{2-p}} \leq C\left\|\phi_{1}-\phi_{2}\right\|_{W^{1, p}(\Omega)^{\prime}} \tag{2.3}
\end{equation*}
$$

Now we observe that

$$
\left\|u_{i}\right\|_{W^{1, p}(\Omega)}^{p} \leq\left\|\phi_{i}\right\|_{W^{1, p}(\Omega)^{\prime}}\left\|u_{i}\right\|_{W^{1, p}(\Omega)}
$$

Hence, (2.3) becomes

$$
\begin{aligned}
& \left\|A_{p}\left(\phi_{1}\right)-A_{p}\left(\phi_{2}\right)\right\|_{W^{1, p}(\Omega)} \leq \\
& C\left(\left\|\phi_{1}\right\|_{W^{1, p}(\Omega)^{\prime}}^{\frac{1}{p-1}}+\left\|\phi_{2}\right\|_{W^{1, p}(\Omega)^{\prime}}^{\frac{1}{p-1}}\right)^{2-p}\left\|\phi_{1}-\phi_{2}\right\|_{W^{1, p}(\Omega)^{\prime}}
\end{aligned}
$$

and the proof is finished.
With this Lemma we can verify the Palais-Smale condition for $\mathcal{F}$.
Lemma 2.2. The functional $\mathcal{F}$ satisfies the Palais-Smale condition.
Proof. Let $\left(u_{k}\right)_{k \geq 1} \subset W^{1, p}(\Omega)$ be a Palais-Smale sequence, that is a sequence such that

$$
\begin{equation*}
\mathcal{F}\left(u_{k}\right) \rightarrow c \quad \text { and } \quad \mathcal{F}^{\prime}\left(u_{k}\right) \rightarrow 0 \tag{2.4}
\end{equation*}
$$

Let us first prove that (2.4) implies that $\left(u_{k}\right)$ is bounded. From (2.4) it follows that there exists a sequence $\varepsilon_{k} \rightarrow 0$ such that

$$
\left|\mathcal{F}^{\prime}\left(u_{k}\right) w\right| \leq \varepsilon_{k}\|w\|_{W^{1, p}(\Omega)}, \quad \forall w \in W^{1, p}(\Omega)
$$

Now we have,

$$
\begin{aligned}
c+1 & \geq \mathcal{F}\left(u_{k}\right)-\frac{1}{q} \mathcal{F}^{\prime}\left(u_{k}\right) u_{k}+\frac{1}{q} \mathcal{F}^{\prime}\left(u_{k}\right) u_{k} \\
& =\left(\frac{1}{p}-\frac{1}{q}\right)\left\|u_{k}\right\|_{W^{1, p}(\Omega)}^{p}+\frac{1}{q} \mathcal{F}^{\prime}\left(u_{k}\right) u_{k} \\
& \geq\left(\frac{1}{p}-\frac{1}{q}\right)\left\|u_{k}\right\|_{W^{1, p}(\Omega)}^{p}-\frac{1}{q}\left\|u_{k}\right\|_{W^{1, p}(\Omega)} \varepsilon_{k} \\
& \geq\left(\frac{1}{p}-\frac{1}{q}\right)\left\|u_{k}\right\|_{W^{1, p}(\Omega)}^{p}-\frac{1}{q}\left\|u_{k}\right\|_{W^{1, p}(\Omega)}
\end{aligned}
$$

hence, $u_{k}$ is bounded in $W^{1, p}(\Omega)$.
By compactness we can assume that $u_{k} \rightharpoonup u$ weakly in $W^{1, p}(\Omega)$ and $u_{k} \rightarrow u$ strongly in $L^{q}(\partial \Omega)$ and a.e. in $\partial \Omega$. Then, as $p<q<p^{*}$, it follows that, $\left|u_{k}\right|^{q-2} u_{k} \rightarrow$ $|u|^{q-2} u$ in $L^{p^{*}}(\partial \Omega)$ and hence in $W^{1, p}(\Omega)^{\prime}$. Therefore, according to Lemma 2.1,

$$
u_{k} \rightarrow A_{p}\left(|u|^{q-2} u\right), \quad \text { in } W^{1, p}(\Omega)
$$

This completes the proof.
Now we introduce a topological tool, the genus, that was introduced in [18] but we will use an equivalent definition due to [9].

Given a Banach Space $X$, we consider the class

$$
\Sigma=\{A \subset X: A \text { is closed, } A=-A\} .
$$

Over this class we define the genus, $\gamma: \Sigma \rightarrow \mathbb{N} \cup\{\infty\}$, as

$$
\gamma(A)=\min \left\{k \in \mathbb{N}: \quad \text { there exists } \varphi \in C\left(A, \mathbb{R}^{k}-\{0\}\right), \varphi(x)=-\varphi(-x)\right\}
$$

For the proof of Theorem 1.2, we will use the following Theorem whose proof can be found in [1],
Theorem 2.1. ([1], Theorem 2.23) Let $\mathcal{F}: X \rightarrow \mathbb{R}$ verifying
(1) $\mathcal{F} \in C^{1}(X)$ and even.
(2) $\mathcal{F}$ verifies the Palais-Smale condition.
(3) There exists a constant $r>0$ such that $\mathcal{F}(u)>0$ in $0<\|u\|_{X}<r$, and $\mathcal{F}(u) \geq c>0$ if $\|u\|_{X}=r$.
(4) There exists a closed subspace $E_{m} \subset X$ of dimension $m$, and a compact set $A_{m} \subset E_{m}$ such that $\mathcal{F}<0$ on $A_{m}$ and 0 lies in a bounded component of $E_{m}-A_{m}$ in $E_{m}$.
Let $B$ be the unit ball in $X$, we define
$\Gamma=\{h \in C(X, X): h(0)=0, h$ is an odd homeomorphism and $\mathcal{F}(h(B)) \geq 0\}$,
and
$\mathcal{K}_{m}=\{K \subset X: K=-K, K$ is compact, and $\gamma(K \cap h(\partial B)) \geq m$ for all $h \in \Gamma\}$.
Then,

$$
c_{m}=\inf _{K \in \mathcal{K}_{m}} \max _{u \in K} \mathcal{F}(u)
$$

is a critical value of $\mathcal{F}$, with $0<c \leq c_{m} \leq c_{m+1}<\infty$. Moreover, if $c_{m}=c_{m+1}=$ $\cdots=c_{m+r}$ then $\gamma\left(K_{c_{m}}\right) \geq r+1$ where $K_{c_{m}}=\left\{u \in X: \mathcal{F}^{\prime}(u)=0, \mathcal{F}(u)=c_{m}\right\}$.

Now we are ready to prove the main result of this section.
Proof of Theorem 1.1 We need to check the hypotheses of Theorem 2.1.
The fact that $\mathcal{F}$ is $C^{1}$ is a straightforward adaptation of the results in [23]. The Palais-Smale condition was already checked in Lemma 2.2.

Let us now check 3. From the Sobolev immersion theorem, we obtain
$\mathcal{F}(u)=\frac{1}{p}\|u\|_{W^{1, p}(\Omega)}^{p}-\frac{\lambda}{q}\|u\|_{L^{q}(\partial \Omega)}^{q} \geq \frac{1}{p}\|u\|_{W^{1, p}(\Omega)}^{p}-C \frac{\lambda}{q}\|u\|_{W^{1, p}(\Omega)}^{q}=g\left(\|u\|_{W^{1, p}(\Omega)}\right)$
where $g(t)=\frac{1}{p} t^{p}-C \frac{\lambda}{q} t^{q}$. As $q>p, 3$ follows for $r=r(C, \lambda, p, q)$ small.
Finally, to verify 4 , let us consider a sequence of subspaces $E_{m} \subset W^{1, p}(\Omega)$ of dimension $m$ such that $E_{m} \subset E_{m+1}$ and $\left.u\right|_{\partial \Omega} \not \equiv 0$ for $u \neq 0, u \in E_{m}$. Hence,

$$
\min _{u \in B_{m}} \int_{\partial \Omega}|u|^{q} d \sigma>0
$$

where $B_{m}=\left\{u \in E_{m}:\|u\|_{W^{1, p}(\Omega)}=1\right\}$. Now we observe that

$$
\mathcal{F}(t u) \leq \frac{t^{p}}{p}\|u\|_{W^{1, p}(\Omega)}-\frac{\lambda t^{q}}{q} \min _{u \in B_{m}} \int_{\partial \Omega}|u|^{q} d \sigma<0
$$

for all $u \in B_{m}$ and $t \geq t_{0}$. Therefore, 4 follows by taking $A_{m}=t_{0} B_{m}$.
In order to see that the critical points of $\mathcal{F}$ that we have found are unbounded in $W^{1, p}(\Omega)$, we need the following result,
Lemma 2.3. Let $\left(c_{m}\right) \subset \mathbb{R}$ be the sequence of critical values given by Theorem 2.1. Then $\lim _{m \rightarrow \infty} c_{m}=\infty$.
Proof. Let $M=\left\{u \in W^{1, p}(\Omega)-\{0\}: \frac{1}{\lambda p}\|u\|_{W^{1, p}(\Omega)}^{p} \leq\|u\|_{L^{q}(\partial \Omega)}^{q}\right\}$. By the Sobolev trace Theorem, there exists a constant $r>0$ such that

$$
\begin{equation*}
r<\|u\|_{L^{q}(\partial \Omega)}^{q}, \quad \forall u \in M \tag{2.5}
\end{equation*}
$$

Let us define

$$
b_{m}=\sup _{h \in \Gamma} \inf _{\left\{u \in \partial B \cap E_{m-1}^{c}\right\}} \mathcal{F}(h(u))
$$

It is proved in [1] that $b_{m} \leq c_{m}$, hence to prove our result it is enough to show that $b_{m} \rightarrow \infty$.

Now, $b_{m+1} \geq \inf _{u \in \partial B \cap E_{m}^{c}} \mathcal{F}(h(u))$ for all $h \in \Gamma$. We will construct $\tilde{h}_{m} \in \Gamma$ such that $\lim _{m \rightarrow \infty} \inf _{u \in \partial B \cap E_{m}^{c}} \mathcal{F}\left(\tilde{h}_{m}(u)\right)=\infty$. First, let us define the following sequence

$$
d_{m}=\inf \left\{\|u\|_{W^{1, p}(\Omega)}: u \in M \cap E_{m}^{c}\right\}
$$

and observe that $d_{m} \rightarrow \infty$. In fact if not, there exists a sequence $u_{m} \in M \cap E_{m}^{c}$ such that $u_{m} \rightharpoonup 0$ weakly in $W^{1, p}(\Omega)$ and therefore $u_{m} \rightarrow 0$ in $L^{q}(\partial \Omega)$, a contradiction with (2.5).

Next, let us consider $h_{m}(u)=R^{-1} d_{m} u$ where $R>1$ is to be fixed. From $h_{m}$ we will construct $\tilde{h}_{m}$.

Given $u \in W^{1, p}(\Omega)$ such that $\left.u\right|_{\partial \Omega \neq 0} 0$, pick $\beta=\beta(u)$ such that

$$
\frac{1}{\lambda p}\|\beta u\|_{W^{1, p}(\Omega)}^{p}=\|\beta u\|_{L^{q}(\partial \Omega)}^{q}
$$

so $\beta u \in M$.

If we consider $g(t)=\mathcal{F}(t u)$ with $\left.u\right|_{\partial \Omega} \not \equiv 0$, it is easy to see that $g$ is increasing in $[0, \beta(u)]$ so $g$ achieves its maximum on that interval for $t=\beta(u)$.

Take $u_{0} \in E_{m}^{c} \cap B$ such that $\left.u_{0}\right|_{\partial \Omega} \neq 0$, then for $R>1$,

$$
R^{-1} d_{m} \leq d_{m} \leq\left\|\beta u_{0}\right\|_{W^{1, p}(\Omega)}=\beta\left(u_{0}\right)
$$

This inequality implies that for every $R>1$ and for every $u_{0} \in E_{m}^{c} \cap B$ such that $\left.u_{0}\right|_{\partial \Omega} \not \equiv 0$ it holds

$$
\mathcal{F}\left(h_{m}\left(u_{0}\right)\right)=\mathcal{F}\left(R^{-1} d_{m} u_{0}\right) \geq 0
$$

As $h_{m}(0)=0$, it follows that

$$
h_{m}\left(E_{m}^{c} \cap B\right) \subset\left\{u \in W^{1, p}(\Omega): \mathcal{F}(u) \geq 0\right\}
$$

therefore, $\left.h_{m}\right|_{E_{m}^{c}}$ satisfies the requirements needed in order to belong to $\Gamma$ so it comes natural try to extend $h_{m}$ to $W^{1, p}(\Omega)$ so it belongs to $\Gamma$.

Given $\varepsilon>0$, consider $Z_{\varepsilon}=d_{m} R^{-1}\left(E_{m}^{c} \cap B\right)+\varepsilon\left(E_{m} \cap B\right)$. Let us see that for $\varepsilon$ small, $Z_{\varepsilon} \subset M^{c}$. If not, there exists a sequence $\varepsilon_{j} \rightarrow 0$ and a sequence $\left(u_{j}\right) \subset M$ such that $u_{j} \in Z_{\varepsilon_{j}}$. In particular, $u_{j}$ is bounded in $W^{1, p}(\Omega)$ so we can assume that

$$
\begin{array}{ll}
u_{j} \rightharpoonup u & \text { weakly in } W^{1, p}(\Omega) \\
u_{j} \rightarrow u & \text { in } L^{q}(\partial \Omega)
\end{array}
$$

Moreover, as $u_{j} \in M$ it follows that $\left.u\right|_{\partial \Omega \neq 0} 0$. On the other hand, as $\|\cdot\|_{W^{1, p}(\Omega)}$ is weakly lower semi-continuous, we have that $u \in M$ and, as $\varepsilon_{j} \rightarrow 0, u \in$ $d_{m} R^{-1}\left(E_{m}^{c} \cap B\right)$ a contradiction.

So we have proved that there exists $\varepsilon_{0}>0$ such that $Z_{\varepsilon_{0}} \subset M^{c}$. This fact allows us to define

$$
\tilde{h}_{m}(u)= \begin{cases}h_{m}(u)=d_{m} R^{-1} u & \text { if } u \in E_{m}^{c} \\ \varepsilon_{0} u & \text { if } u \in E_{m}\end{cases}
$$

Now, if $u \in E_{m} \cap B$ we have

$$
\tilde{h}_{m}(u)=\varepsilon_{0} u \in Z_{\varepsilon_{0}} \subset M^{c}
$$

then

$$
\begin{aligned}
\mathcal{F}\left(\tilde{h}_{m}(u)\right) & =\mathcal{F}\left(\varepsilon_{0} u\right)=\frac{1}{p}\left\|\varepsilon_{0} u\right\|_{W^{1, p}(\Omega)}^{p}-\frac{\lambda}{q}\left\|\varepsilon_{0} u\right\|_{L^{q}(\partial \Omega)}^{q} \\
& =\frac{\lambda}{q}\left(\frac{q-1}{\lambda p}\left\|\varepsilon_{0} u\right\|_{W^{1, p}(\Omega)}^{p}+\left(\frac{1}{\lambda p}\left\|\varepsilon_{0} u\right\|_{W^{1, p}(\Omega)}^{p}-\left\|\varepsilon_{0} u\right\|_{L^{q}(\partial \Omega)}^{q}\right)\right) \geq 0
\end{aligned}
$$

that is, given $u \in B$ if we decompose $u=u_{1}+u_{2}$ with $u_{1} \in E_{m}^{c}$ and $u_{2} \in E_{m} \cap B$, we obtain $\tilde{h}_{m}(u)=\tilde{h}_{m}\left(u_{1}\right)+\tilde{h}_{m}\left(u_{2}\right)=d_{m} R^{-1} u_{1}+\varepsilon_{0} u_{2} \in Z_{\varepsilon_{0}} \subset M^{c}$ from where it follows that $\mathcal{F}\left(\tilde{h}_{m}(u)\right) \geq 0$ and hence $\tilde{h}_{m} \in \Gamma$.

Finally, we need to prove that $\mathcal{F}\left(\tilde{h}_{m}(u)\right) \rightarrow \infty$ as $m \rightarrow \infty$ for $u \in \partial B \cap E_{m}^{c}$, but this follows from the facts that $d_{m} \rightarrow \infty$, that $d_{m} \leq \beta(u)$ for $u \in B \cap E_{m}^{c}$ and that we can choose $R$ large enough.

If $u \in \partial B \cap E_{m}^{c}, \tilde{h}_{m}(u)=d_{m} R^{-1} u$ and

$$
\begin{aligned}
\mathcal{F}\left(\tilde{h}_{m}(u)\right) & =\frac{\left(d_{m} R^{-1}\right)^{p}}{p}\|u\|_{W^{1, p}(\Omega)}^{p}-\frac{\lambda\left(d_{m} R^{-1}\right)^{q}}{q}\|u\|_{L^{q}(\partial \Omega)}^{q} \\
& =\left(d_{m} R^{-1}\right)^{p}\left(\frac{1}{p}-\frac{\lambda}{q}\left(d_{m} R^{-1}\right)^{q-p}\|u\|_{L^{q}(\partial \Omega)}^{q}\right) \\
& \geq\left(d_{m} R^{-1}\right)^{p}\left(\frac{1}{p}-\frac{\lambda}{q}\left(\beta(u) R^{-1}\right)^{q-p}\|u\|_{L^{q}(\partial \Omega)}^{q}\right) \\
& =\left(d_{m} R^{-1}\right)^{p}\left(\frac{1}{p}-\frac{R^{p-q}}{p q}\right)
\end{aligned}
$$

As $q>p$ we conclude that if $R$ is large enough, then $\mathcal{F}\left(\tilde{h}_{m}(u)\right) \rightarrow+\infty$.

## 3. Proof of Theorem 1.2. The subcritical case II

Now we deal with $f(u)=\lambda|u|^{q-2} u$ in the case $1<q<p$. In this case, we look for nonpositive critical values of $\mathcal{F}$.

We begin by the following Lemma.
Lemma 3.1. For every $n \in \mathbb{N}$ there exists a constant $\varepsilon>0$ such that

$$
\gamma\left(\mathcal{F}^{-\varepsilon}\right) \geq n
$$

where $\mathcal{F}^{c}=\left\{u \in W^{1, p}(\Omega): \mathcal{F}(u) \leq c\right\}$.
Proof. Let $E_{n} \subset W^{1, p}(\Omega)$ be a $n$-dimensional subspace such that $\left.u\right|_{\partial \Omega} \not \equiv 0$ for all $u \in E_{n}, u \neq 0$ (cf. Section 2).

Hence we have, for $u \in E_{n},\|u\|_{W^{1, p}(\Omega)}=1$,

$$
\begin{equation*}
\mathcal{F}(t u)=\frac{t^{p}}{p}-\frac{\lambda t^{q}}{q} \int_{\partial \Omega}|u|^{q} d \sigma \leq \frac{t^{p}}{p}-a_{n} \frac{\lambda t^{q}}{q} \tag{3.1}
\end{equation*}
$$

where $a_{n}=\inf \left\{\int_{\partial \Omega}|u|^{q} d \sigma: u \in E_{n},\|u\|_{W^{1, p}(\Omega)}=1\right\}$. Observe that $a_{n}>0$ because $E_{n}$ is finite dimensional. As $q<p$ we obtain from (3.1) that there exists positive constants $\rho$ and $\varepsilon$ such that

$$
\mathcal{F}(\rho u)<-\varepsilon \quad \text { for } u \in E_{n},\|u\|_{W^{1, p}(\Omega)}=\rho
$$

Therefore, if we set $S_{\rho, n}=\left\{u \in E_{n}:\|u\|_{W^{1, p}(\Omega)}=\rho\right\}$, we have that $S_{\rho, n} \subset \mathcal{F}^{-\varepsilon}$. Hence by the monotonicity of the genus

$$
\gamma\left(\mathcal{F}^{-\varepsilon}\right) \geq \gamma\left(S_{\rho, n}\right)=n
$$

as we wanted to show.
Lemma 3.2. The functional $\mathcal{F}$ is bounded below and verifies the Palais-Smale condition.

Proof. First, by the Sobolev-trace inequality, we have

$$
\mathcal{F}(u) \geq \frac{1}{p}\|u\|_{W^{1, p}(\Omega)}^{p}-C \frac{\lambda}{q}\|u\|_{W^{1, p}(\Omega)}^{q} \equiv h\left(\|u\|_{W^{1, p}(\Omega)}\right),
$$

where $h(t)=\frac{1}{p} t^{p}-C \frac{\lambda}{q} t^{q}$. As $h(t)$ is bounded below we conclude that $\mathcal{F}$ is bounded below.

Now to prove the Palais-Smale condition, let $u_{j} \in W^{1, p}(\Omega)$ a Palais-Smale sequence. As $c=\lim _{j \rightarrow \infty} \mathcal{F}\left(u_{j}\right)$, using that $\mathcal{F}^{\prime}\left(u_{j}\right)=\varepsilon_{j} \rightarrow 0$ in $W^{1, p}(\Omega)^{\prime}$ we have that, for $j$ large enough,

$$
\begin{aligned}
c-1 & \leq\left(\frac{1}{p}-\frac{1}{q}\right)\left\|u_{j}\right\|_{W^{1, p}(\Omega)}^{p}+\frac{1}{q}\left\langle\varepsilon_{j}, u_{j}\right\rangle \\
& \leq\left(\frac{1}{p}-\frac{1}{q}\right)\left\|u_{j}\right\|_{W^{1, p}(\Omega)}^{p}+\frac{1}{q}\left\|\varepsilon_{j}\right\|_{\left(W^{1, p}(\Omega)\right)^{\prime}}\left\|u_{j}\right\|_{W^{1, p}(\Omega)} \\
& \leq\left(\frac{1}{p}-\frac{1}{q}\right)\left\|u_{j}\right\|_{W^{1, p}(\Omega)}^{p}+\frac{1}{q}\left\|u_{j}\right\|_{W^{1, p}(\Omega)},
\end{aligned}
$$

from where it follows that $\left\|u_{j}\right\|_{W^{1, p}(\Omega)} \leq C$ (recall that $p>q$ ).
Therefore, for a subsequence,

$$
\begin{array}{ll}
u_{j} \rightharpoonup u & \text { weakly in } W^{1, p}(\Omega), \\
u_{j} \rightarrow u & \text { in } L^{q}(\partial \Omega)
\end{array}
$$

and the result follows as in Lemma 2.2.
Finally, the followings two Theorems give us the proof of Theorem 1.2.
Theorem 3.1. Let

$$
\begin{aligned}
\Sigma & =\left\{A \subset W^{1, p}(\Omega)-\{0\}: A \text { is closed, } A=-A\right\}, \\
\Sigma_{k} & =\{A \subset \Sigma: \gamma(A) \geq k\},
\end{aligned}
$$

where $\gamma$ stands for the genus.
Then

$$
c_{k}=\inf _{A \in \Sigma_{k}} \sup _{u \in A} \mathcal{F}(u)
$$

is a negative critical value of $\mathcal{F}$ and moreover, if $c=c_{k}=\cdots=c_{k+r}$, then $\gamma\left(K_{c}\right) \geq r+1$, where $K_{c}=\left\{u \in W^{1, p}(\Omega): \mathcal{F}(u)=c, \mathcal{F}^{\prime}(u)=0\right\}$.

Proof. According to Lemma 3.1 for every $k \in \mathbb{N}$ there exists $\varepsilon>0$ such that $\gamma\left(\mathcal{F}^{-\varepsilon}\right) \geq k$. As $\mathcal{F}$ is even and continuous it follows that $\mathcal{F}^{-\varepsilon} \in \Sigma_{k}$ therefore $c_{k} \leq-\varepsilon<0$. Moreover by Lemma 3.2, $\mathcal{F}$ is bounded below so $c_{k}>-\infty$. Let us now see that $c_{k}$ is in fact a critical value for $\mathcal{F}$. To this end let us suppose that $c=c_{k}=\cdots=c_{k+r}$. As $\mathcal{F}$ is even it follows that $K_{c}$ is symmetric. The PalaisSmale condition implies that $K_{c}$ is compact, therefore if $\gamma\left(K_{c}\right) \leq r$ by the continuity property of the genus (see [23]) there exists a neighborhood of $K_{c}, N_{\delta}\left(K_{c}\right)=\{v \in$ $\left.W^{1, p}(\Omega): d\left(v, K_{c}\right) \leq \delta\right\}$, such that $\gamma\left(N_{\delta}\left(K_{c}\right)\right)=\gamma\left(K_{c}\right) \leq r$.

By the usual deformation argument, we get

$$
\eta\left(1, \mathcal{F}^{c+\varepsilon / 2}-N_{\delta}\left(K_{c}\right)\right) \subset \mathcal{F}^{c-\varepsilon / 2}
$$

On the other hand, by the definition of $c_{k+r}$ there exists $A \subset \Sigma_{k+r}$ such that $A \subset \mathcal{F}^{c+\varepsilon / 2}$ hence

$$
\begin{equation*}
\eta\left(1, A-N_{\delta}\left(K_{c}\right)\right) \subset \mathcal{F}^{c-\varepsilon / 2} . \tag{3.2}
\end{equation*}
$$

Now by the monotonicity of the genus (see [23]), we have

$$
\gamma\left(\overline{A-N_{\delta}\left(K_{c}\right)}\right) \geq \gamma(A)-\gamma\left(N_{\delta}\left(K_{c}\right)\right) \geq k .
$$

As $\eta(1, \cdot)$ is an odd homeomorphism it follows that (see [23])

$$
\gamma\left(\eta\left(1, \overline{A-N_{\delta}\left(K_{c}\right)}\right)\right) \geq \gamma\left(\overline{A-N_{\delta}\left(K_{c}\right)}\right) \geq k
$$

But as $\eta\left(1, \overline{A-N_{\delta}\left(K_{c}\right)}\right) \in \Sigma_{k}$ then

$$
\sup _{u \in \eta\left(1, \overline{\left.A-N_{\delta}\left(K_{c}\right)\right)}\right.} \mathcal{F}(u) \geq c=c_{k}
$$

a contradiction with (3.2).
We end the section showing that the critical points of $\mathcal{F}$ are a compact set of $W^{1, p}(\Omega)$.
Theorem 3.2. The set $K=\left\{u \in W^{1, p}(\Omega): \mathcal{F}^{\prime}(u)=0\right\}$ is compact in $W^{1, p}(\Omega)$.
Proof. As $\mathcal{F}$ is $C^{1}$ it is immediate that $K$ is closed. Let $u_{j}$ be a sequence in $K$. We have that

$$
0=F^{\prime}\left(u_{j}\right) u_{j}=\left\|u_{j}\right\|_{W^{1, p}(\Omega)}^{p}-\lambda \int_{\partial \Omega}\left|u_{j}\right|^{q} d \sigma \geq\left\|u_{j}\right\|_{W^{1, p}(\Omega)}^{p}-C \lambda\left\|u_{j}\right\|_{W^{1, p}(\Omega)}^{q}
$$

As $1<q<p$, we conclude that $u_{j}$ is bounded in $W^{1, p}(\Omega)$. Now we can use Palais-Smale condition to extract a convergent subsequence.

## 4. Proof of Theorem 1.3. A nonlinear eigenvalue problem

In this section we deal with $f(u)=\lambda|u|^{p-2} u$, which is a nonlinear eigenvalue problem.

Let us consider $M_{\alpha}=\left\{u \in W^{1, p}(\Omega):\|u\|_{W^{1, p}(\Omega)}^{p}=p \alpha\right\}$ and

$$
\varphi(u)=\frac{1}{p} \int_{\partial \Omega}|u|^{p} d \sigma
$$

We are looking for critical points of $\varphi$ restricted to the manifold $M_{\alpha}$ using a minimax technique.

Let us define $\rho: W^{1, p}(\Omega)-\{0\} \rightarrow(0,+\infty)$ by

$$
\rho(u)=\left(\frac{p \alpha}{\|u\|_{W^{1, p}(\Omega)}^{p}}\right)^{\frac{1}{p}} .
$$

This function $\rho$ is even, bounded away the origin and verifies that $\rho(u) u \in M_{\alpha}$ if $u \neq 0$. Moreover, we have that the derivative of $\rho$ is given by

$$
\begin{equation*}
\left\langle\rho^{\prime}(u), v\right\rangle=-(p \alpha)^{1 / p}\|u\|_{W^{1, p}(\Omega)}^{-(p+1)}\left(\int_{\Omega}|\nabla u|^{p-2} \nabla u \nabla v+|u|^{p-2} u v d x\right) \tag{4.1}
\end{equation*}
$$

We observe that $\rho^{\prime}$ is odd and continuous uniformly over bounded sets away from the origin. It is straightforward to check, from (4.1), that $\left\langle\rho^{\prime}(u), v\right\rangle=0$ if and only if $\int_{\Omega}|\nabla u|^{p-2} \nabla u \nabla v+|u|^{p-2} u v d x=0$.

As $p>1$, it follows that $W^{1, p}(\Omega)$ is a reflexive uniformly convex Banach space so given $\varphi \in W^{1, p}(\Omega)^{\prime}$ there exists a unique element in $W^{1, p}(\Omega)$, that we will denote by $J(\varphi)$ such that

$$
\begin{aligned}
\langle\varphi, J(\varphi)\rangle & =\|\varphi\|_{W^{1, p}(\Omega)^{\prime}}^{2} \\
\|J(\varphi)\|_{W^{1, p}(\Omega)} & =\|\varphi\|_{W^{1, p}(\Omega)^{\prime}}
\end{aligned}
$$

Therefore we define $J: W^{1, p}(\Omega)^{\prime} \rightarrow W^{1, p}(\Omega)$ the duality mapping which is odd and uniformly continuous over bounded sets.

Let us now define

$$
\begin{aligned}
&\langle P u ; v\rangle=\frac{\int_{\partial \Omega}|u|^{p} d \sigma}{\|u\|_{W^{1, p}(\Omega)}^{p}}\left(\int_{\Omega}|\nabla u|^{p-2} \nabla u \nabla v+|u|^{p-2} u v d x\right. \\
&\left.-\int_{\partial \Omega}|\nabla u|^{p-2} \frac{\partial u}{\partial \nu} v d \sigma\right) \\
&\langle D u ; v\rangle=\int_{\partial \Omega}|u|^{p-2} u v d \sigma-\langle P u ; v\rangle
\end{aligned}
$$

and

$$
T u=J(D u)-A u,
$$

where $A$ is given by

$$
A=\frac{\left\langle\rho^{\prime}(u) ; J(D u)\right\rangle\langle P u+D u ; u\rangle+\langle P u ; J(D u)\rangle}{\left(\left\langle\rho^{\prime}(u) ; u\right\rangle+1\right)\langle P u+D u ; u\rangle} .
$$

This application, $T$, is uniformly continuous and odd. Moreover, it is bounded in $M_{\alpha}$, so there exists constants $\tau_{0}, \gamma_{0}>0$ such that, for every $\tau \in\left[-\tau_{0}, \tau_{0}\right]$ and every $u \in M_{\alpha}$ it holds

$$
\|u+\tau T u\|_{W^{1, p}(\Omega)} \geq \gamma_{0}>0 .
$$

Now, we are able to define the flow

$$
H(u, \tau)=\rho(u+\tau T u)(u+\tau T u),
$$

so we obtain a well defined application, $H$, which is odd in $u$, uniformly continuous and verifies $H(u, 0)=u$.

The main property of $H$ is that defines trajectories in $M_{\alpha}$ along which the functional $\varphi$ is increasing.
Lemma 4.1. There exists an application $r(u, \tau)$ such that $r(u, \tau) \rightarrow 0$ as $\tau \rightarrow 0$ uniformly in $u \in M_{\alpha}$ and

$$
\varphi(H(u, \tau))=\varphi(u)+\int_{0}^{\tau}\|D u\|_{W^{1, p}(\Omega)^{\prime}}^{2}+r(u, s) d s
$$

for every $u \in M_{\alpha}, \tau \in\left[-\tau_{0}, \tau_{0}\right]$.
Proof. An elementary computation gives us

$$
\begin{aligned}
\varphi(H(u, \tau)) & =\varphi(u)+\int_{0}^{\tau}\left\langle\varphi^{\prime}(H(u, s)) ; \frac{\partial H}{\partial s}(u, s)\right\rangle d s \\
& =\varphi(u)+\int_{0}^{\tau}\|D u\|_{W^{1, p}(\Omega)^{\prime}}^{2}+\left\langle\varphi^{\prime}(H(u, s)) ; \frac{\partial H}{\partial s}(u, s)\right\rangle-\langle D u ; J(D u)\rangle d s
\end{aligned}
$$

Hence, if we call $r(u, \tau)=\left\langle\varphi^{\prime}(H(u, s)) ; \frac{\partial}{\partial s} H(u, s)\right\rangle-\langle D u ; J(D u)\rangle$, by our choice of $A$ it holds that $r(u, 0)=0$, and the result follows as $T$ (and therefore $H$ ) is bounded in $M_{\alpha}$.

Now we are ready to prove the Deformation Lemma needed in order to apply the mini-max technique.
Lemma 4.2. Given $\beta>0$, we denote $\varphi_{\beta}=\left\{u \in M_{\alpha}: \varphi(u) \geq \beta\right\}$. Let $\beta>0$ be fixed, and suppose that there exists a relatively open set $U \subset M_{\alpha}$ and positive constants $\delta<\rho$ such that

$$
\|D u\|_{W^{1, p}(\Omega)^{\prime}} \geq \delta, \quad \text { if } u \in V_{\rho}=\left\{u \in M_{\alpha}: u \notin U, \text { and }|\varphi(u)-\beta| \leq \rho\right\} .
$$

Then, there exists an $\varepsilon>0$ and a continuous, odd operator $H_{\varepsilon}$ such that

$$
H_{\varepsilon}\left(\varphi_{\beta-\varepsilon}-U\right) \subset \varphi_{\beta+\varepsilon} .
$$

Proof. First, we take $\tau_{1}>0$ such that $|r(u, \tau)| \leq \frac{1}{2} \delta^{2}$ for all $u \in M_{\alpha}, \tau \in\left[-\tau_{1}, \tau_{1}\right]$.
By Lemma 4.1 we have that $\varphi(H(u, \tau)) \geq \varphi(u)+\frac{1}{2} \delta^{2} \tau$ for every $u \in V_{\rho}$ and $0<\tau<\tau_{1}$.

Let $\varepsilon=\min \left\{\rho, \frac{1}{4} \delta^{2} \tau_{1}\right\}$, and from the definition of $V_{\rho}$, if $u \in V_{\rho} \cap \varphi_{\beta-\varepsilon}$, we obtain

$$
\varphi\left(H\left(u, \tau_{1}\right)\right) \geq \varphi(u)+2 \varepsilon \geq \beta+\varepsilon
$$

Again by Lemma 4.1, given $u \in V_{\rho}$, we have that $\varphi(H(u, \tau))$ is strictly increasing for $\tau$ small, and hence we can define

$$
t_{\varepsilon}(u)=\min \{\tau \geq 0: \varphi(H(u, \tau))=\beta+\varepsilon\}
$$

This $t_{\varepsilon}(u)$ is well defined, continuous and verifies $0<t_{\varepsilon}(u) \leq \tau_{1}$. Now, we choose $H_{\varepsilon}$ as

$$
H_{\varepsilon}(u)= \begin{cases}H\left(u, t_{\varepsilon}(u)\right) & \text { if } u \in V_{\varepsilon} \\ u & \text { if } u \in \varphi_{\beta-\varepsilon}-\left(U \cup V_{\varepsilon}\right) .\end{cases}
$$

Finally it is straightforward to check that $H_{\varepsilon}$ satisfies all our requirements.
Now we prove the Palais-Smale condition for the functional $\varphi$ on $M_{\alpha}$.
Lemma 4.3. Let $\beta>0$ and $\left(u_{j}\right) \subset M_{\alpha}$ be a Palais-Smale sequence on $M_{\alpha}$ above level $\beta$, that is

$$
\varphi\left(u_{j}\right) \geq \beta, \quad D u_{j} \rightarrow 0
$$

Then there exists a subsequence that converges strongly in $W^{1, p}(\Omega)$.
Proof. As $M_{\alpha}$ is bounded, we can assume that $u_{j} \rightharpoonup u$ weakly in $W^{1, p}(\Omega)$. Also, as $\varphi$ is compact, we can assume that $\varphi\left(u_{j}\right) \rightarrow \varphi(u)$ and hence $\varphi(u) \geq \beta$ and

$$
\mu_{j} \equiv \frac{\int_{\partial \Omega}\left|u_{j}\right|^{p} d \sigma}{\left\|u_{j}\right\|_{W^{1, p}(\Omega)}^{p}} \rightarrow \mu \equiv \frac{\int_{\partial \Omega}|u|^{p} d \sigma}{\alpha p}
$$

therefore $u \not \equiv 0$ and $\varphi^{\prime}(u) \neq 0$.
Now, as $\varphi^{\prime}$ is compact and $D u_{j} \rightarrow 0$ we have

$$
0=\lim _{j} D u_{j}=\lim _{j} \varphi^{\prime}\left(u_{j}\right)-P u_{j}=\varphi^{\prime}(u)-\mu \lim _{j} P_{0} u_{j},
$$

where

$$
\left\langle P_{0} u_{j} ; v\right\rangle=\int_{\Omega}|\nabla u|^{p-2} \nabla u \nabla v+|u|^{p-2} u v d x-\int_{\partial \Omega}|\nabla u|^{p-2} \frac{\partial u}{\partial \nu} v d \sigma .
$$

Therefore $P_{0} u_{j} \rightarrow \mu^{-1} \varphi^{\prime}(u)$ and the result follows applying Lemma 2.1 as $A_{p}=$ $P_{0}^{-1}$.

Theorem 4.1. Let $C_{k}=\left\{C \subset M_{\alpha}: C\right.$ is compact, symmetric and $\left.\gamma(C) \leq k\right\}$ and let

$$
\begin{equation*}
\beta_{k}=\sup _{C \in C_{k}} \min _{u \in C} \varphi(u) . \tag{4.2}
\end{equation*}
$$

Then $\beta_{k}>0$ and there exists $u_{k} \in M_{\alpha}$ such that $\varphi\left(u_{k}\right)=\beta_{k}$ and $u_{k}$ is a weak solution of (1.1) with $\lambda_{k}=\alpha / \beta_{k}$.

Proof. First, let us see that $\beta_{k}>0$. It is immediate that $\gamma\left(M_{\alpha}\right)=+\infty$, hence $\beta_{k}$ is well defined in the sense that for every $k, C_{k} \neq \emptyset$. As we can choose a set $C \in C_{k}$ with the property $\left.u\right|_{\partial \Omega} \not \equiv 0$ if $u \in C$, we conclude that $\beta_{k}=\sup _{C \in C_{k}} \min _{u \in C} \varphi(u)>$ 0 .

Now, for a fixed $k$ let us prove the existence of the solution $u_{k}$. First, let us see that there exists a sequence $\left(u_{j}\right) \in M_{\alpha}$ such that $\varphi\left(u_{j}\right) \rightarrow \beta_{k}$ and $D u_{j} \rightarrow 0$. To see this fact, assume that it is false, then there exists positive constants $\delta$ and $\rho$ such that

$$
\|D u\| \geq \delta, \quad \text { if } u \in M_{\alpha} \text { and }\left|\varphi(u)-\beta_{k}\right| \leq \rho
$$

We can assume that $\delta<\beta_{k}$. By the deformation Lemma 4.2 there exists a constant $\varepsilon>0$ and a continuous and odd $H_{\varepsilon}$ such that $H_{\varepsilon}\left(\varphi_{\beta_{k}-\varepsilon}\right) \subset \varphi_{\beta_{k}+\varepsilon}$. By the definition of $\beta_{k}$ there exists $C_{\varepsilon} \in C_{k}$ such that $\varphi(u) \geq \beta_{k}-\varepsilon$ for every $u \in C_{\varepsilon}$, then $\varphi(u) \geq$ $\beta_{k}+\varepsilon$ for every $u \in H_{\varepsilon}\left(C_{\varepsilon}\right)$. But we have that $\gamma\left(H_{\varepsilon}\left(C_{\varepsilon}\right)\right) \geq k$ a contradiction with the definition of $\beta_{k}$. So we have proved that there exits a sequence $\left(u_{j}\right) \in$ $M_{\alpha}$ such that $\varphi\left(u_{j}\right) \rightarrow \beta_{k}$ and $D u_{j} \rightarrow 0$. From Lemma 4.3 we can extract a converging subsequence $u_{j} \rightarrow u_{k}$ that gives us the desired solution that must verify, by continuity of $\varphi, \varphi\left(u_{k}\right)=\beta_{k}$.

This Theorem proves the existence of nontrivial solutions for (1.1) but we can prove the following
Theorem 4.2. Let $K_{j}=\left\{u \in M_{\alpha} ; \varphi(u)=\beta_{j}, D u=0\right\}$. If $\beta_{j}=\beta_{j+1}=\cdots=$ $\beta_{j+r}$, then $\gamma\left(K_{j}\right) \geq r+1$.
Proof. The proof is analogous to that of Theorem 3.1.
In this way we have proved the existence of infinitely many solutions. The next Theorem gives us the existence of infinitely many eigenvalues.
Theorem 4.3. Let $\beta_{k}$ be as in (4.2), then

$$
\lim _{k} \beta_{k}=0,
$$

and therefore

$$
\lim _{k} \lambda_{k}=+\infty .
$$

Proof. Let $E_{j}$ be a sequence of subspaces of $W^{1, p}(\Omega)$, such that $E_{i} \subset E_{i+1}, \overline{\cup E_{i}}=$ $W^{1, p}(\Omega)$ and $\operatorname{dim}\left(E_{i}\right)=i$. Let $E_{i}^{c}$ the topological complementary of $E_{i}$.

Let

$$
\tilde{\beta}_{k}=\sup _{C \in C_{k}} \min _{u \in C \cap E_{k-1}^{c}} \varphi(u) .
$$

$\tilde{\beta}_{k}$ is well defined and $\tilde{\beta}_{k} \geq \beta>0$. Let us prove that $\lim _{k} \tilde{\beta}_{k}=0$. Assume, by contradiction, that there exists a constant $\kappa>0$ such that $\tilde{\beta}_{k}>\kappa>0$ for all $k$. Then for every $k$ there exists $C_{k}$ such that

$$
\tilde{\beta}_{k}>\min _{u \in C_{k} \cap E_{k-1}^{c}} \varphi(u)>\kappa
$$

Hence there exists $u_{k} \in C_{k} \cap E_{k-1}^{c}$ such that

$$
\tilde{\beta}_{k}>\varphi\left(u_{k}\right)>\kappa .
$$

As $M_{\alpha}$ is bounded, we can assume, taking a subsequence if necessary, that $u_{k} \rightharpoonup u$ weakly in $W^{1, p}(\Omega)$ and $u_{k} \rightarrow u$ strongly in $L^{p}(\partial \Omega)$. Hence $\varphi(u) \geq \kappa>0$ but this is a contradiction with the fact that $u \equiv 0$ because $u_{k} \in E_{k-1}^{c}$.

## 5. Proof of Theorem 1.4. The critical case I

In this section we study the critical case with a perturbation. We consider $f(u)=|u|^{p^{*}-2} u+\lambda|u|^{r-2} u$ with $p<r<p^{*}$.

To prove our existence result, since we have lost the compactness in the inclusion $W^{1, p}(\Omega) \hookrightarrow L^{p^{*}}(\partial \Omega)$, we can no longer expect the Palais-Smale condition to hold. Anyway we can prove a local Palais-Smale condition that will hold for $\mathcal{F}(u)$ below a certain value of energy.

The technical result used here, the concentrated compactness method, is mainly due to [19], [20].

Let $u_{j}$ be a bounded sequence in $W^{1, p}(\Omega)$ then there exists a subsequence that we still denote $u_{j}$, such that

$$
\begin{array}{ll}
u_{j} \rightharpoonup u & \text { weakly in } W^{1, p}(\Omega), \\
u_{j} \rightarrow u \quad \text { strongly in } L^{r}(\partial \Omega), \quad 1 \leq r<p^{*}, \\
\left|\nabla u_{j}\right|^{p} \rightharpoonup d \mu,\left.\quad\left|u_{j}\right| \partial \Omega\right|^{p^{*}} \rightharpoonup d \eta,
\end{array}
$$

* weakly in the sense of measures. We observe that $d \eta$ is a measure supported on $\partial \Omega$.

If we consider $\phi \in C^{\infty}(\bar{\Omega})$, from the Sobolev trace inequality we obtain, passing to the limit,

$$
\begin{equation*}
\left(\int_{\partial \Omega}|\phi|^{p^{*}} d \eta\right)^{\frac{1}{p^{*}}} S^{1 / p} \leq\left(\int_{\Omega}|\phi|^{p} d \mu+\int_{\Omega}|u|^{p}|\nabla \phi|^{p} d x+\int_{\Omega}|\phi u|^{p} d x\right)^{1 / p} \tag{5.1}
\end{equation*}
$$

where $S$ is the best constant in the Sobolev trace embedding Theorem.
¿From (5.1), we observe that, if $u=0$ we get a reverse Holder type inequality (but it involves one integral over $\partial \Omega$ and one over $\Omega$ ) between the two measures $\mu$ and $\eta$.

Now we state the following Lemma due to [19], [20].
Lemma 5.1. Let $u_{j}$ be a weakly convergent sequence in $W^{1, p}(\Omega)$ with weak limit $u$ such that

$$
\left|\nabla u_{j}\right|^{p} \rightharpoonup d \mu \quad \text { and }\left.\quad\left|u_{j}\right|_{\partial \Omega}\right|^{p^{*}} \rightharpoonup d \eta
$$

* weakly in the sense of measures. Then there exists $x_{1}, \ldots, x_{l} \in \partial \Omega$ such that
(1) $d \eta=|u|^{p^{*}}+\sum_{j=1}^{l} \eta_{j} \delta_{x_{j}}, \eta_{j}>0$,
(2) $d \mu \geq|\nabla u|^{p}+\sum_{j=1}^{l} \mu_{j} \delta_{x_{j}}, \mu_{j}>0$,
(3) $\left(\eta_{j}\right)^{\frac{p}{p^{*}}} \leq \frac{\mu_{j}}{S}$

Next, we use Lemma 5.1 to prove a local Palais-Smale condition.
Lemma 5.2. Let $u_{j} \subset W^{1, p}(\Omega)$ be a Palais-Smale sequence for $\mathcal{F}$, with energy level c. If $c<\left(\frac{1}{p}-\frac{1}{p^{*}}\right) S^{\frac{p^{*}}{p^{*}-p}}$, where $S$ is the best constant in the Sobolev trace inequality, then there exists a subsequence $u_{j_{k}}$ that converges strongly in $W^{1, p}(\Omega)$.

Proof. From the fact that $u_{j}$ is a Palais-Smale sequence it follows that $u_{j}$ is bounded in $W^{1, p}(\Omega)$ (see Lemma 2.2). By Lemma 5.1 there exists a subsequence, that we
still denote $u_{j}$, such that

$$
\begin{align*}
& u_{j} \rightharpoonup u \text { weakly in } W^{1, p}(\Omega), \\
& u_{j} \rightarrow u \text { in } L^{r}(\partial \Omega), 1<r<p^{*}, \text { and a.e. in } \partial \Omega, \\
& \left|\nabla u_{j}\right|^{p} \rightharpoonup d \mu \geq|\nabla u|^{p}+\sum_{k=1}^{l} \mu_{k} \delta_{x_{k}},  \tag{5.2}\\
& \left.\left|u_{j}\right|_{\partial \Omega}\right|^{p^{*}} \rightharpoonup d \eta=\left.|u|_{\partial \Omega}\right|^{p^{*}}+\sum_{k=1}^{l} \eta_{k} \delta_{x_{k}} .
\end{align*}
$$

Let $\phi \in C^{\infty}\left(\mathbb{R}^{N}\right)$ such that

$$
\phi \equiv 1 \text { in } B\left(x_{k}, \varepsilon\right), \quad \phi \equiv 0 \text { in } B\left(x_{k}, 2 \varepsilon\right)^{c}, \quad|\nabla \phi| \leq \frac{2}{\varepsilon}
$$

where $x_{k}$ belongs to the support of $d \eta$.
Consider $\left\{u_{j} \phi\right\}$. Obviously this sequence is bounded in $W^{1, p}(\Omega)$. As $\mathcal{F}^{\prime}\left(u_{j}\right) \rightarrow 0$ in $W^{1, p}(\Omega)^{\prime}$, we obtain that

$$
\lim _{j \rightarrow \infty}\left\langle\mathcal{F}^{\prime}\left(u_{j}\right) ; \phi u_{j}\right\rangle=0
$$

By (5.2) we obtain,
$\lim _{j \rightarrow \infty} \int_{\Omega}\left|\nabla u_{j}\right|^{p-2} \nabla u_{j} \nabla \phi u_{j} d x=\int_{\partial \Omega} \phi d \eta+\lambda \int_{\partial \Omega}|u|^{r} \phi d \sigma-\int_{\Omega} \phi d \mu-\int_{\Omega}|u|^{p} \phi d x$.
Now, by Hölder inequality and weak convergence, we obtain

$$
\begin{aligned}
0 & \leq\left.\lim _{j \rightarrow \infty}\left|\int_{\Omega}\right| \nabla u_{j}\right|^{p-2} \nabla u_{j} \nabla \phi u_{j} d x \mid \\
& \leq \lim _{j \rightarrow \infty}\left(\int_{\Omega}\left|\nabla u_{j}\right|^{p} d x\right)^{(p-1) / p}\left(\int_{\Omega}|\nabla \phi|^{p}\left|u_{j}\right|^{p} d x\right)^{1 / p} \\
& \leq C\left(\int_{B\left(x_{k}, 2 \varepsilon\right) \cap \Omega}|\nabla \phi|^{p}|u|^{p} d x\right)^{1 / p} \\
& \leq C\left(\int_{B\left(x_{k}, 2 \varepsilon\right) \cap \Omega}|\nabla \phi|^{N} d x\right)^{1 / N}\left(\int_{B\left(x_{k}, 2 \varepsilon\right) \cap \Omega}|u|^{p N /(N-p)} d x\right)^{(N-p) / p N} \\
& \leq C\left(\int_{B\left(x_{k}, 2 \varepsilon\right) \cap \Omega}|u|^{p N /(N-p)} d x\right)^{(N-p) / p N} \rightarrow 0 \quad \text { as } \varepsilon \rightarrow 0
\end{aligned}
$$

Then

$$
\begin{equation*}
\lim _{\varepsilon \rightarrow 0}\left[\int_{\partial \Omega} \phi d \eta+\lambda \int_{\partial \Omega}|u|^{r} \phi d \sigma-\int_{\Omega} \phi d \mu-\int_{\Omega}|u|^{p} \phi d x\right]=\eta_{k}-\mu_{k}=0 \tag{5.3}
\end{equation*}
$$

By Lemma 5.1 we have that $\left(\eta_{k}\right)^{\frac{p}{p^{*}}} S \leq \mu_{k}$, therefore by (5.3) we obtain

$$
\left(\eta_{k}\right)^{\frac{p}{p^{*}}} S \leq \eta_{k}
$$

Then, either $\eta_{k}=0$ or

$$
\begin{equation*}
\eta_{k} \geq S^{\frac{p^{*}}{p^{*}-p}} \tag{5.4}
\end{equation*}
$$

If (5.4) does indeed occur for some $k_{0}$ then, from the fact that $u_{j}$ is a Palais-Smale sequence, we obtain

$$
\begin{align*}
c & =\lim _{j \rightarrow \infty} \mathcal{F}\left(u_{j}\right)=\lim _{j \rightarrow \infty} \mathcal{F}\left(u_{j}\right)-\frac{1}{p}\left\langle\mathcal{F}^{\prime}\left(u_{j}\right) ; u_{j}\right\rangle \\
& \geq\left(\frac{1}{p}-\frac{1}{p^{*}}\right) \int_{\partial \Omega}|u|^{p^{*}} d \sigma+\left(\frac{1}{p}-\frac{1}{p^{*}}\right) S^{\frac{p^{*}}{p^{*}-p}}+\lambda\left(\frac{1}{p}-\frac{1}{r}\right) \int_{\partial \Omega}|u|^{r} d \sigma  \tag{5.5}\\
& \geq\left(\frac{1}{p}-\frac{1}{p^{*}}\right) S^{\frac{p^{*}}{p^{*}-p}} .
\end{align*}
$$

As $c<\left(\frac{1}{p}-\frac{1}{p^{*}}\right) S^{\frac{p^{*}}{p^{*}-p}}$, it follows that $\left.\int_{\partial \Omega}\left|u_{j}\right|\right|^{p^{*}} d \sigma \rightarrow \int_{\partial \Omega}|u|^{p^{*}} d \sigma$ and therefore $u_{j} \rightarrow u$ in $L^{p^{*}}(\partial \Omega)$. Now the proof finishes using the continuity of the operator $A_{p}$.

Proof of Theorem 1.4: In view of the previous result, we seek for critical values below level $c$. For that purpose, we want to use the Mountain Pass Lemma. Hence we have to check the following conditions:

1) There exist constants $R, r>0$ such that if $\|u\|_{W^{1, p}(\Omega)}=R$, then $\mathcal{F}(u)>r$.
2) There exists $v_{0} \in W^{1, p}(\Omega)$ such that $\left\|v_{0}\right\|_{W^{1, p}(\Omega)}>R$ and $\mathcal{F}\left(v_{0}\right)<r$.

Let us first check 1). By the Sobolev trace Theorem we have,

$$
\begin{aligned}
\mathcal{F}(u) & =\frac{1}{p}\|u\|_{W^{1, p}(\Omega)}^{p}-\frac{1}{p^{*}} \int_{\partial \Omega}|u|^{p^{*}} d \sigma-\frac{\lambda}{r} \int_{\partial \Omega}|u|^{r} d \sigma \\
& \geq \frac{1}{p}\|u\|_{W^{1, p}(\Omega)}^{p}-\frac{1}{p^{*}} S^{p^{*}}\|u\|_{W^{1, p}(\Omega)}^{p^{*}}-\frac{\lambda}{r} C\|u\|_{W^{1, p}(\Omega)}^{r} .
\end{aligned}
$$

Let

$$
g(t)=\frac{1}{p} t^{p}-\frac{1}{p^{*}} S^{p^{*}} t^{p^{*}}-\frac{\lambda}{r} C t^{r}
$$

It is easy to check that $g(R)>r$ for some $R, r>0$.
$2)$ is immediate as for a fixed $w \in W^{1, p}(\Omega)$ with $\left.w\right|_{\partial \Omega \neq 0}$ we have

$$
\lim _{t \rightarrow \infty} \mathcal{F}(t w)=-\infty
$$

Now the candidate for critical value according to the Mountain Pass Theorem is

$$
\begin{equation*}
c=\inf _{\phi \in \mathcal{C}} \sup _{t \in[0,1]} \mathcal{F}(\phi(t)), \tag{5.6}
\end{equation*}
$$

where $\mathcal{C}=\left\{\phi:[0,1] \rightarrow W^{1, p}(\Omega) ;\right.$ continuous and $\left.\phi(0)=0, \phi(1)=v_{0}\right\}$. The problem is to show that $c<\left(\frac{1}{p}-\frac{1}{p^{*}}\right) S^{\frac{p^{*}}{p^{*}-p}}$ in order to apply the local PalaisSmale condition.

We fix $w \in W^{1, p}(\Omega)$ with $\|w\|_{L^{p^{*}}(\partial \Omega)}=1$, and define $h(t)=\mathcal{F}(t w)$. We want to study the maximum of $h$. As $\lim _{t \rightarrow \infty} h(t)=-\infty$ it follows that there exists a $t_{\lambda}>0$ such that $\sup _{t>0} \mathcal{F}(t w)=h\left(t_{\lambda}\right)$. Differentiating we obtain,

$$
\begin{equation*}
0=h^{\prime}\left(t_{\lambda}\right)=t_{\lambda}^{p-1}\|w\|_{W^{1, p}(\Omega)}^{p}-t_{\lambda}^{p^{*}-1}-t_{\lambda}^{r-1} \lambda\|w\|_{L^{r}(\partial \Omega)}^{r}, \tag{5.7}
\end{equation*}
$$

from where it follows that

$$
\|w\|_{W^{1, p}(\Omega)}^{p}=t_{\lambda}^{p^{*}-p}+t_{\lambda}^{r-p} \lambda\|w\|_{L^{r}(\partial \Omega)}^{r} .
$$

Hence $t_{\lambda} \leq\|w\|_{W^{1, p}(\Omega)}^{\frac{p}{p^{*}-p}}$, then from (5.7) as $t_{\lambda}^{p^{*}-r}+\lambda\|w\|_{L^{r}(\partial \Omega)}^{r} \rightarrow \infty$ as $\lambda \rightarrow \infty$, we obtain that

$$
\begin{equation*}
\lim _{\lambda \rightarrow \infty} t_{\lambda}=0 \tag{5.8}
\end{equation*}
$$

On the other hand, it is easy to check that if $\lambda>\tilde{\lambda}$ it must be $\mathcal{F}\left(t_{\tilde{\lambda}} w\right) \geq \mathcal{F}\left(t_{\lambda} w\right)$, so by (5.8) we get

$$
\lim _{\lambda \rightarrow \infty} \mathcal{F}\left(t_{\lambda} w\right)=0
$$

But this identity means that there exists a constant $\lambda_{0}>0$ such that if $\lambda \geq \lambda_{0}$, then

$$
\sup _{t \geq 0} \mathcal{F}(t w)<\left(\frac{1}{p}-\frac{1}{p^{*}}\right) S^{\frac{p^{*}}{p^{*}-p}},
$$

and the proof is finished if we choose $v_{0}=t_{0} w$ with $t_{0}$ large in order to have $\mathcal{F}\left(t_{0} w\right)<0$.

## 6. Proof of Theorem 1.5. The critical case II

In this section we deal with problem (1.4) when $1<q<p$ that is we are considering $f(u)=|u|^{p^{*}-2} u+\lambda|u|^{r-2} u$. Applying a mini-max technique we will show the existence of infinitely many nontrivial critical points of the asociated functional $\mathcal{F}$ when $\lambda$ is small enough.

We begin, as in the previous section, using Lemma 5.1 to prove a local PalaisSmale condition.
Lemma 6.1. Let $\left(u_{j}\right) \subset W^{1, p}(\Omega)$ be a Palais-Smale sequence for $\mathcal{F}$, with energy level c. If $c<\left(\frac{1}{p}-\frac{1}{p^{*}}\right) S^{\frac{p^{*}}{p^{*}-p}}-K \lambda^{\frac{p^{*}}{p^{*}-r}}$, where $K$ depends only on $p, r, N$, and $|\partial \Omega|$, then there exists a subsequence $\left(u_{j_{k}}\right)$ that converges strongly in $W^{1, p}(\Omega)$.
Proof. From the fact that $u_{j}$ is a Palais-Smale sequence it follows that $u_{j}$ is bounded in $W^{1, p}(\Omega)$ (see Lemma 2.2 and Lemma 5.2).

Now the proof follows exactly as in Lemma 5.2 until we get to

$$
c \geq\left(\frac{1}{p}-\frac{1}{p^{*}}\right) \int_{\partial \Omega}|u|^{p^{*}} d \sigma+\left(\frac{1}{p}-\frac{1}{p^{*}}\right) S^{\frac{p^{*}}{p^{*}-p}}+\lambda\left(\frac{1}{p}-\frac{1}{r}\right) \int_{\partial \Omega}|u|^{r} d \sigma
$$

where $u$ is the weak limit of $u_{j}$ in $W^{1, p}(\Omega)$.
Applying now Hölder inequality, we find

$$
c \geq\left(\frac{1}{p}-\frac{1}{p^{*}}\right) S^{\frac{p^{*}}{p^{*}-p}}+\left(\frac{1}{p}-\frac{1}{p^{*}}\right)\|u\|_{L^{p^{*}}(\partial \Omega)}^{p^{*}}+\lambda\left(\frac{1}{p}-\frac{1}{r}\right)|\partial \Omega|^{1-\frac{r}{p^{*}}}\|u\|_{L^{p^{*}}(\partial \Omega)}^{r} .
$$

Now, let $f(x)=c_{1} x^{p^{*}}-\lambda c_{2} x^{r}$. This function reaches its absolute minimum at $x_{0}=\left(\frac{\lambda c_{2} r}{p^{*} c_{1}}\right)^{\frac{1}{p^{*}-r}}$, that is

$$
f(x) \geq f\left(x_{0}\right)=-K \lambda^{\frac{p^{*}}{p^{*}-r}},
$$

where $K=K(p, q, N,|\partial \Omega|)$.
Hence $c \geq\left(\frac{1}{p}-\frac{1}{p^{*}}\right) S^{p^{p^{*}}}{ }^{p^{*}-p}-K \lambda^{\frac{p^{*}}{p^{*}-r}}$, which contradicts our hypothesis. Therefore

$$
\lim _{j \rightarrow \infty} \int_{\partial \Omega}\left|u_{j}\right|^{p^{*}} d \sigma=\int_{\partial \Omega}|u|^{p^{*}} d \sigma
$$

and the rest of the proof is as that of Lemma 5.2.

We now observe, using the Sobolev trace Theorem, that

$$
\mathcal{F}(u) \geq \frac{1}{p}\|u\|_{W^{1, p}(\Omega)}^{p}-c_{1}\|u\|_{W^{1, p}(\Omega)}^{p^{*}}-\lambda c_{2}\|u\|_{W^{1, p}(\Omega)}^{r}=j\left(\|u\|_{W^{1, p}(\Omega)}\right)
$$

where $j(x)=\frac{1}{p} x^{p}-c_{1} x^{p^{*}}-\lambda c_{2} x^{r}$. As $j$ attains a local but not a global minimum ( $j$ is not bounded below), we have to perform some sort of truncation. To this end let $x_{0}, x_{1}$ be such that $m<x_{0}<M<x_{1}$ where $m$ is the local minimum of $j$ and $M$ is the local maximum and $j\left(x_{1}\right)>j(m)$. For these values $x_{0}$ and $x_{1}$ we can choose a smooth function $\tau(x)$ such that $\tau(x)=1$ if $x \leq x_{0}, \tau(x)=0$ if $x \geq x_{1}$ and $0 \leq \tau(x) \leq 1$. Finally, let $\varphi(u)=\tau\left(\|u\|_{W^{1, p}(\Omega)}\right)$ and define the truncated functional as follows

$$
\tilde{\mathcal{F}}(u)=\frac{1}{p} \int_{\Omega}|\nabla u|^{p}+|u|^{p} d x-\frac{1}{p^{*}} \int_{\partial \Omega}|u|^{p^{*}} \varphi(u) d \sigma-\frac{\lambda}{r} \int_{\partial \Omega}|u|^{r} d \sigma .
$$

As above, $\tilde{\mathcal{F}}(u) \geq \tilde{j}\left(\|u\|_{W^{1, p}(\Omega)}\right)$ where $\tilde{j}(x)=\frac{1}{p} x^{p}-c_{1} x^{p^{*}} \tau(x)-\lambda c_{2} x^{r}$. We observe that if $x \leq x_{0}$ then $\tilde{j}(x)=j(x)$ and if $x \geq x_{1}$ then $\tilde{j}(x)=\frac{1}{p} x^{p}-\lambda c_{2} x^{r}$.

Now we state a Lemma that contains the main properties of $\tilde{\mathcal{F}}$.
Lemma 6.2. $\tilde{\mathcal{F}}$ is $C^{1}$, if $\tilde{\mathcal{F}}(u) \leq 0$ then $\|u\|_{W^{1, p}(\Omega)}<x_{0}$ and $\mathcal{F}(v)=\tilde{\mathcal{F}}(v)$ for every $v$ close enough to $u$. Moreover there exists $\lambda_{1}>0$ such that if $0<\lambda<\lambda_{1}$ then $\tilde{\mathcal{F}}$ satisfies a local Palais-Smale condition for $c \leq 0$.

Proof. We only have to check the local Palais-Smale condition. Observe that every Palais-Smale sequence for $\tilde{\mathcal{F}}$ with energy level $c \leq 0$ must be bounded, therefore by Lemma 6.1 if $\lambda$ verifies $0<\left(\frac{1}{p}-\frac{1}{p^{*}}\right) S^{\frac{p^{*}}{p^{*}-p}}-K \lambda^{\frac{p^{*}}{p^{*}-r}}$ then there exists a convergent subsequence.

The following Lemma gives the final ingredients needed in the proof of Theorem 1.3 .

Lemma 6.3. For every $n \in \mathbb{N}$ there exists $\varepsilon>0$ such that

$$
\gamma\left(\tilde{\mathcal{F}}^{-\varepsilon}\right) \geq n
$$

where $\tilde{\mathcal{F}}^{-\varepsilon}=\{u, \tilde{\mathcal{F}}(u) \leq-\varepsilon\}$.
Proof. The proof is analogous to that of Lemma 3.1.
Finally, we are ready to prove the main result of this section.
Proof of Theorem 1.5: The proof is analogous to that of Theorem 1.2, here we use Lemma 6.1 and Lemma 6.3 instead of Lemma 3.2 and Lemma 3.1 respectively to work with the functional $\tilde{\mathcal{F}}$ and Lemma 6.2 to conclude on $\mathcal{F}$.

## 7. Proof of Theorem 1.6. The supercritical case

In this section we will consider a nonlinearity $f$ of the form

$$
f(u)=\lambda|u|^{q-2} u+|u|^{r-2} u,
$$

where $q \geq p^{*}>r>p$. In this case the functional $\mathcal{F}$ is not well defined in $W^{1, p}(\Omega)$, so in order to apply variational arguments we perform a truncation on the supercritical term, find a solution of the truncated problem and finally show that this solution lies below the truncation level so it is a solution of our original problem.

Proof of Theorem 1.6: We follow ideas from [4]. Let us consider the following truncation of $|u|^{q-2} u$

$$
h(u)= \begin{cases}0 & u<0 \\ u^{q-1} & 0 \leq u<K \\ K^{q-r} u^{r-1} & u \geq K\end{cases}
$$

Then $h$ verifies $h(u) \leq K^{q-r} u^{r-1}$.
So we consider the truncated problem

$$
\left\{\begin{align*}
\Delta_{p} u & =u^{p-1} & & \text { in } \Omega  \tag{7.1}\\
|\nabla u|^{p-2} \frac{\partial u}{\partial \nu} & =\lambda h(u)+u^{r-1} & & \text { on } \partial \Omega
\end{align*}\right.
$$

and we look a positive nontrivial solution of (7.1) that satisfies $u \leq K$. Such a solution will be a nontrivial positive solution of (1.1).

To this end, we consider the truncated functional

$$
\begin{equation*}
\mathcal{F}_{\lambda}(u)=\frac{1}{p} \int_{\Omega}|\nabla u|^{p}+|u|^{p} d x-\lambda \int_{\partial \Omega} H(u) d \sigma-\int_{\partial \Omega} \frac{|u|^{r}}{r} d \sigma, \tag{7.2}
\end{equation*}
$$

where $H(u)$ verifies $H^{\prime}(u)=h(u)$.
By the results of $\S 2$ there exists a Mountain Pass solution $u=u_{\lambda}$ for (7.1), that is a critical point of $\mathcal{F}_{\lambda}$ with energy level $c_{\lambda}$. One can easily check that this least energy solution $u$ is positive. Moreover the energy level $c_{\lambda}$ is a decreasing function of $\lambda$, so we have that $\mathcal{F}_{\lambda}(u)=c_{\lambda} \leq c_{0}$. Now using (7.2), (7.1) and that $H(u) \leq \frac{1}{r} h(u) u$ we have that

$$
\begin{aligned}
c_{0} & \geq \mathcal{F}_{\lambda}(u)=\frac{1}{p} \int_{\Omega}|\nabla u|^{p}+|u|^{p} d x-\lambda \int_{\partial \Omega} H(u) d \sigma-\int_{\partial \Omega} \frac{|u|^{r}}{r} d \sigma \\
& \geq \frac{1}{p} \int_{\Omega}|\nabla u|^{p}+|u|^{p} d x-\frac{1}{r}\left(\lambda \int_{\partial \Omega} h(u) u d \sigma+\int_{\partial \Omega}|u|^{r} d \sigma\right) \\
& =\left(\frac{1}{p}-\frac{1}{r}\right) \int_{\Omega}|\nabla u|^{p}+|u|^{p} d x .
\end{aligned}
$$

So, as $r>p$ we obtain

$$
\|u\|_{W^{1, p}(\Omega)} \leq C=C\left(c_{0}, p, r\right) .
$$

Now by the Sobolev trace inequality we get

$$
\begin{equation*}
\|u\|_{L^{s}(\partial \Omega)} \leq S^{-1 / p}\|u\|_{W^{1, p}(\Omega)} \leq C=C\left(c_{0}, p, r, s, \Omega\right) . \tag{7.3}
\end{equation*}
$$

Let us define

$$
u_{L}(x)= \begin{cases}u(x) & u(x) \leq L \\ L & u(x)>L\end{cases}
$$

Multiplying the equation (7.1) by $u_{L}^{p \beta} u$ we get

$$
\int_{\Omega}|\nabla u|^{p-2} \nabla u \nabla\left(u_{L}^{p \beta} u\right) d x+\int_{\Omega} u^{p} u_{L}^{p \beta} d x=\lambda \int_{\partial \Omega} h(u) u u_{L}^{p \beta} d \sigma+\int_{\partial \Omega} u^{r} u_{L}^{p \beta} d \sigma .
$$

Therefore, using that $h(u) u \leq K^{q-r} u^{r}$ and the definition of $u_{L}$, we obtain

$$
\int_{\Omega}|\nabla u|^{p} u_{L}^{p \beta} d x+\int_{\Omega} u^{p} u_{L}^{p \beta} d x \leq\left(\lambda K^{q-r}+1\right) \int_{\partial \Omega} u^{r} u_{L}^{p \beta} d \sigma .
$$

Now we set $w_{L}=u u_{L}^{\beta}$. Then, we obtain

$$
\begin{aligned}
\left\|w_{L}\right\|_{W^{1, p}(\Omega)}^{p} & =\int_{\Omega}\left|\nabla w_{L}\right|^{p}+\left|w_{L}\right|^{p} d x \\
& \leq C\left(\int_{\Omega}|\nabla u|^{p} u_{L}^{p \beta} d x+\int_{\Omega} u^{p} \beta^{p} u_{L}^{p(\beta-1)}\left|\nabla u_{L}\right|^{p} d x+\int_{\Omega} u^{p} u_{L}^{p \beta} d x\right) \\
& \leq C\left(\int_{\Omega}|\nabla u|^{p} u_{L}^{p \beta} d x+\int_{\Omega} u^{p} u_{L}^{p \beta} d x\right) \leq C\left(\lambda K^{q-r}+1\right) \int_{\partial \Omega} u^{r} u_{L}^{p \beta} d \sigma .
\end{aligned}
$$

Therefore, by Holder and Sobolev trace inequalities, we get

$$
\begin{aligned}
\left\|w_{L}\right\|_{L^{p^{*}}(\partial \Omega)}^{p} & \leq S^{-1}\left\|w_{L}\right\|_{W^{1, p}(\Omega)}^{p} \leq C\left(\lambda K^{q-r}+1\right) \int_{\partial \Omega} u^{r} u_{L}^{p \beta} d \sigma \\
& \leq C\left(\lambda K^{q-r}+1\right)\left(\int_{\partial \Omega} u^{p^{*}} d \sigma\right)^{\frac{r-p}{p^{*}}}\left(\int_{\partial \Omega} w_{L}^{\alpha^{*}} d \sigma\right)^{\frac{p}{\alpha^{*}}}
\end{aligned}
$$

where $\alpha^{*}=\frac{p p^{*}}{p^{*}-r+p}<p^{*}$. So by (7.3),

$$
\begin{aligned}
\left\|w_{L}\right\|_{L^{p^{*}}(\partial \Omega)}^{p} & \leq C\left(\lambda K^{q-r}+1\right)\|u\|_{L^{p^{*}}(\partial \Omega)}^{r-p}\left\|w_{L}\right\|_{L^{\alpha^{*}}(\partial \Omega)}^{p} \\
& \leq C\left(\lambda K^{q-r}+1\right)\left\|w_{L}\right\|_{L^{\alpha^{*}}(\partial \Omega)}^{p} .
\end{aligned}
$$

Now if $u^{\beta+1} \in L^{\alpha^{*}}(\partial \Omega)$ by the dominated convergence Theorem and Fatou's Lemma we get

$$
\left\|u^{\beta+1}\right\|_{L^{p^{*}}(\partial \Omega)}^{p} \leq C\left(\lambda K^{q-r}+1\right)\left\|u^{\beta+1}\right\|_{L^{\alpha^{*}}(\partial \Omega)}^{p}
$$

that is,

$$
\|u\|_{L^{p^{*}(\beta+1)}(\partial \Omega)} \leq C\left(\lambda K^{q-r}+1\right)^{\frac{\beta+1}{p}}\|u\|_{L^{\alpha^{*}(\beta+1)}(\partial \Omega)}
$$

Let $\kappa=\frac{p^{*}}{\alpha^{*}}$, iterating the last inequality we have

$$
\|u\|_{L^{\kappa j} \alpha^{*}(\partial \Omega)} \leq C\left(\lambda K^{q-r}+1\right)^{\theta}\|u\|_{L^{\alpha^{*}}(\partial \Omega)} .
$$

Using again (7.3) we get

$$
\|u\|_{L^{\infty}(\partial \Omega)} \leq C\left(\lambda K^{q-r}+1\right)^{\theta}
$$

Hence, if $K_{0}>C$, for every $K \geq K_{0}$ there exists $\lambda(K)$ such that if $\lambda<\lambda(K)$ then

$$
\|u\|_{L^{\infty}(\partial \Omega)} \leq K
$$

This finishes the proof.

## 8. Proof of Theorem 1.7. A nonexistence result

In this Section we prove a nonexistence result for positive regular decaying solutions for (1.1) in $\mathbb{R}_{+}^{N}=\left\{x_{1}>0\right\}$. That is we are dealing with a positive regular solution of

$$
\left\{\begin{align*}
\Delta_{p} u & =u^{p-1} & & \text { in } \mathbb{R}_{+}^{N},  \tag{8.1}\\
|\nabla u|^{p-2} \frac{\partial u}{\partial \nu} & =u^{q-1} & & \text { on } \partial \mathbb{R}_{+}^{N}
\end{align*}\right.
$$

that satisfies the hypotheses of Theorem 1.7.
We observe that in the special case $p=2$ there exists a solution if we drop the decaying assumption, namely $u(x)=e^{-x_{1}}$ is a solution for every $q$.

Proof of Theorem 1.7. First we multiply the equation in (8.1) by $u$ and integrate by parts to obtain

$$
\begin{equation*}
\int_{\mathbb{R}_{+}^{N}}|\nabla u|^{p}+u^{p} d x-\int_{\partial \mathbb{R}_{+}^{N}} u^{q} d x^{\prime}=0 . \tag{8.2}
\end{equation*}
$$

Note that our decaying and integrability assumptions on $u$ justify all the integrations by parts made along this proof.

Now we multiply by $x \nabla u$ and integrate by parts to obtain

$$
-\int_{\mathbb{R}_{+}^{N}}|\nabla u|^{p-2} \nabla u \nabla(x \nabla u) d x+\int_{\partial \mathbb{R}_{+}^{N}} u^{q-1} x \nabla u d x^{\prime}=\frac{1}{p} \int_{\mathbb{R}_{+}^{N}} x \nabla u^{p} d x .
$$

Hence further integrations by parts gives us

$$
\left(-1+\frac{N}{p}\right) \int_{\mathbb{R}_{+}^{N}}|\nabla u|^{p} d x-\frac{N-1}{q} \int_{\partial \mathbb{R}_{+}^{N}} u^{q} d x^{\prime}=\frac{N}{p} \int_{\mathbb{R}_{+}^{N}} u^{p} d x .
$$

Using (8.2) we arrive at

$$
\left(-1+\frac{N}{p}-\frac{N-1}{q}\right) \int_{\partial \mathbb{R}_{+}^{N}} u^{q} d x^{\prime}=\left(-1+\frac{2 N}{p}\right) \int_{\mathbb{R}_{+}^{N}} u^{p} d x>0 .
$$

Therefore, if $u$ is not identically zero, we must have

$$
-1+\frac{N}{p}-\frac{N-1}{q}>0
$$

that is

$$
q>p^{*}=\frac{p(N-1)}{N-p}
$$

as we wanted to show.
Acknowledgements. We want to thank D. G. de Figueiredo, J. Yang, J. GarciaAzorero and I. Peral for several suggestions and interesting discussions.
